

Topic	Word	Question	
Fit for life	- Carbohydrate - Protein - Fiber - vitamin - calcium - grain - dairy - balanced diet - nutrient - unhealthy food - exercise - sleep	Foods and nutrients - These are substances in food that our bodies need to grow, stay healthy, and get energy: nutrient - This nutrient provides the body with energy and is found in foods like bread, pasta, and rice: Carbohydrate - This nutrient can be found in foods like meat, eggs, beans, and nuts: Protein - This nutrient helps keep our digestive system healthy and can be found in fruits, vegetables, and whole grains: fiber - This nutrient is important for storing energy and protecting our organs. It can be found in foods like butter, oils, nuts, and avocados: fat - These are essential nutrients that our body needs in small amounts to stay healthy. Examples include vitamin C in oranges and vitamin D from sunlight: vitamin - This mineral is commonly found in dairy products like milk, cheese, and yogurt: calcium - These are foods that are high in sugar, fat, or salt and offer little nutritional value: unhealthy food Food groups - This food group helps build and repair muscles and tissues: protein - This food group includes items like wheat, rice, oats, and corn: grain - This food group includes milk, cheese, and yogurt, which provide calcium and protein: dairy - These foods are often green, leafy, or colorful and are packed with vitamins and minerals: vegetable - These foods are usually sweet or tart and are rich in vitamins, especially vitamin C: fruit Healthy life - This type of diet includes a variety of foods from all the different food groups in the right amounts: balanced diet - Physical activity that helps keep our bodies strong and healthy: exercise - Rest that is essential for our bodies to repair and our brains to process information: sleep	
Materials	- paper - fabric - wood - metal - plastic - rubber - glass - alloy - flexible - elastic - transparent - waterproof - absorbent	Natural Materials - Thin material made from wood pulp used for writing or packaging: paper - A material made by weaving or knitting threads together, used for making clothes: fabric - Hard material from trees used for building or making items: wood - Solid material that is typically hard, shiny, and good at conducting heat and electricity: metal - Transparent material used in windows: glass Synthetic Materials - A material commonly used for making bottles and containers: plastic - Elastic material made from the sap of rubber trees or synthetic sources, used for gloves: rubber - A mixture of two or more metals: alloy Properties of materials - Able to bend without breaking: flexible - Able to return to its original shape after being stretched or compressed: elastic - Allowing light to pass through: transparent - Resistant to water, not allowing water to pass through: waterproof - able to take liquid in through the surface and to hold it: absorbent	
Matter and changes	- matter - mass - volume - state - solid - liquid - gas - particle - melting - freezing - evaporation - evaporate - boiling - boil - boiling point - condensation - condense - water cycle - heat	State of matter - Anything that has mass and occupies space: Matter - The amount of matter in an object: Mass - The amount of space occupied by an object: volume - Three states of matter: solid, liquid, gas - A state of matter that has a definite shape: solid - A state of matter that has no definite volume: gas - A state of matter that has a definite volume and can flow: liquid Matter changes - The process in which a gas changes into a liquid: condensation - The process of heating a liquid until it changes into a gas at boiling point: boiling - The process in which a liquid changes into a gas: evaporation - The process of changing a liquid into a solid: freezing - The process of changing a solid into a liquid: melting - The continuous movement of water from the Earth's surface up to the sky and back down the Earth again: water cycle	Particle models - A state that particles are very close together and hard to move: Solid - A state that particles are close together and easy to move: Liquid - A state that particles are far away and easy to move: Gas Matter changes in life - what's process that happens when making ice from water? freezing - what's process that happens when ice cream is kept at room temperature? - melting - what's process that happens when wet clothes dry in sunlight? - evaporation - what processes happen when boiling water? - boiling and evaporation - What processes occur in water cycle? - evaporation, condensation

Sound	- sound - sound source - vibrate - vibration - travel - record (v, n) - replay - noise - noise pollution - soundproof - decibel	Basic of sound - What we hear when something makes a noise? Sound - Where does sound come from? Sound source - How can sound sources produce sound? Vibrate - This movement produces sound: vibration - The way sound move from one place to another: travel - To capture sounds or voices so they can be played back later: record - The captured sound or voice: record - To play a recorded sound or video again: replay Impact of sound - A sound, especially one that is loud or unpleasant: noise - This occurs when sounds get too loud or last too long: noise pollution - To prevent sound from coming into a room or building: soundproof - A unit that measures the loudness of sound: decibel	
Light and shadow	- Light - Light source - Reflect - Reflection - Absorption - absorb - Transmission - transmit - Travel - Straight line - Opaque - Transparent - Translucent - Shadow - Block -	Light - What makes things visible and helps us see? light - Where does light come from? light source - We are able to see things when they light into our eyes. (reflect) - The process of light bouncing back from a surface: reflection - When light is taken in by a material and not reflected: absorption - The action of taking in light: absorb - When light passes through a material: Transmission - The action of light passing through something: transmit - What light does as it moves from one place to another: travel - Light travels in (straight lines) What materials let light go through? - A material that does not let any light pass through: opaque. - A material that allows light to pass through completely: transparent. - A material that lets some light through but not all: translucent. Shadow - The dark area created when an object blocks light: shadow - What happens when an object stops light from passing through: block - When the path of light is blocked, a is formed. shadow	

Plants	- Root - Stem - Seed - Flower - Leaf - Fruit - Transport - Dispersal - disperse - Grow - Mineral - Factor - Wither - sunlight - water - air - minerals - photosynthesis - chlorophyll - respiration - carbon dioxide - release - occur - sugar - oxygen - reproduction - pollen grain - pollination - pollinator - fertilization - stigma - ovary - ovule - anther	Parts of a plant: - The part of the plant that grows underground and absorbs water and nutrients: root - The part of the plant that supports leaves, transports water and nutrients: stem - The part of the plant that use sunlight and chlorophyll to convert carbon dioxide and water into sugar: leaf - The part of the plant that produces fruits and seeds: flowers - The part of the plant that protect seeds and helps with seed dispersal: fruit - The part of the plant that produces new plant: seed Plant growth and function: - What plants do when they increase in size: grow. - The process of moving water and nutrients through the plant: transport. - Plant needs - What plants need from the sun to make food: sunlight - Plants use and carbon dioxide to make fruit: water - What plants need from the atmosphere to live: air - Nutrients absorbed by roots from the soil: minerals Photosynthesis and Respiration - The process plants use to make food: photosynthesis - The process plants use energy from sunlight to turn water and carbon dioxide into sugar and release oxygen into the air: photosynthesis - The process by which plants convert sugar and oxygen into energy: respiration - The process of plants occurs in the presence of light (day time): photosynthesis - The process of plants occurs everytime (day time and night time): respiration - The gas plants take in from the air during photosynthesis: carbon dioxide - The substance plants produce during photosynthesis: sugar - The gas released by plants during photosynthesis: oxygen - What do leaves contain that allows plants to carry out photosynthesis? chlorophyll Reproduction - The process by which plants make more of themselves: reproduction - The process when the stigma receives pollen grains from the anther: pollination - The animal that helps move pollen from one flower to another: pollinator. - The process when the pollen and ovules join inside the ovary: fertilization - The process of spreading seeds away from the parent plant: dispersal - What part of plants develops into fruit? ovary - What part of plants develops into seed? ovule	
Animals and food chains	- herbivore - carnivore - omnivore - vertebrate (n, adj) - invertebrate (n, adj) - amphibian - reptile - life cycle - food chain - relationship - food producer - food consumer - predator - prey - food web - organism	Animals - What do we call an animal eats only plants? herbivore - What do we call an animal eats only meat? carnivore - What do we call an animal eats both plants and meat? omnivore - What do we call an animal with backbone? vertebrate - What do we call an animal without backbone? invertebrate - An animal has fins and scales. It breathes through gills: fish - An animal has smooth and moist skin, does not have scales. It breathes through lung: amphibian - An animal has dry skin and scales. It breathes through lung: reptile - An animal has feather and wings. It breathes through lung: bird - An animal has fur or hair. It breathes through lungs: mammal Food chains - What is used to represent the feeding relationship between plants and animals? Food chain - Starting point of feeding relationships in any habitat: food producer - An animal cannot make their own food. It depends on other living things for food: Food consumer - An animal that catches and eats other animals: predator - An animal that is hunted and killed for food by another animal: prey - The connection of many food chains: food web - A single living plant, animal, virus: organism	Animals - Frog is an animal in this group: Amphibian - Snake is an animal in this group: Reptile - Crocodile is an animal in this group: Reptile - Eagle is an animal in this group: Bird - Salmon is an animal in this group: Fish - Whale is an animal in this group: Mammal - Animals are classified into two main groups: Vertebrate and Invertebrate Animals - This animal often hunts other animals for food: carnivore - This animal has flat teeth designed for grinding leaves and stems: herbivore - This animal has a diverse diet that can include fruits, vegetables, and meat: omnivore - This animal group includes species such as mammals, birds, reptiles, amphibians, and fish: vertebrate - This group includes animals like insects, spiders, and mollusks: invertebrate Food chains - It usually starts with a plant and ends with a top predator: food chain - These are often green plants that make their own food using sunlight: food producer - They can be herbivores, carnivores, or omnivores: food consumer - This is more complex than a food chain and shows how different food chains are connected: food web - This term includes anything that is alive, like plants, animals, bacteria, and fungi: organism
Environment and natural resources	- Natural resource - Renewable - Non-renewable - Fossil fuel - Hydropower energy - Biomass energy - Geothermal energy - Nuclear energy	Natural resources - Anything that is supplied by nature and can be used by the living beings: natural resources - A type of resource that has unlimited supply: renewable resource - Air, water and sunlight are grouped into this type of natural resources: renewable resource - A type of resource that has limited supply: non-renewable resource - Coal, petroleum, and natural gas are grouped into this type of natural resources: non-renewable resource Energy from natural resources - Energy sources like coal, oil, and natural gas formed from ancient plant and animal remains: fossil fuel - Energy generated from moving water: hydropower energy - Energy produced from organic materials like plants and animal waste: biomass energy - Energy derived from the heat stored within the Earth: geothermal energy - Energy released from atomic reactions: nuclear energy	

The solar system	- Planet - Statellite - Orbit (n, v) - Axis - Tilt - Hemisphere - Rotate - Rotation - Revolution - Mercury - Venus - Earth - Mars - Jupiter - Saturn - Uranus - Neptune - Sun	Celestial Bodies - A large round object in space that travels around a star, like Earth: Planet - An object that orbits a planet; can be natural (like a moon) or man-made: Statellite - The star at the center of our solar system that gives us light and heat: Sun Orbital Mechanics - The path an object takes as it goes around a star or planet: orbit - To travel around a star or planet in a curved path: orbit - An imaginary line through the middle of a planet that it spins around: axis - The angle at which a planet's axis is tilted compared to its orbit: Tilt Movements and Positions - Half of a sphere, often referring to half of Earth: Hemisphere - To spin around on an axis: rotate - The act of spinning around an axis: rotation - The act of traveling in a path around another object: revolution Planets of the Solar System - The smallest planet and closest to the Sun: Mercury - The second planet from the Sun, known for its thick, cloudy atmosphere: Venus - The third planet from the Sun, where we live: Earth - The fourth planet from the Sun, known as the Red Planet: Mars - The largest planet in our solar system, fifth from the Sun: Jupiter - The sixth planet from the Sun, famous for its rings: Saturn - The seventh planet from the Sun, rotates on its side: Uranus - The eighth planet from the Sun, known for its deep blue color: Neptune	Planets of the Solar System - This is the largest planet in the solar system: Jupiter - This is the smallest planet in the solar system: Mercury - This is known for its rings made from dust and ice: Saturn - This is the hottest planet in the solar system: Venus - This planet looks like it is spinning on its side because it rotates at a nearly 90-degree angle: Uranus - This is the only planet that has life in the solar system: Earth - This planet is red, very dusty and cold: Mars - This is a cold, dark planet that is the farthest planet from the Sun: Neptune
Organ systems of human b	- Organ system - Function - Digestive system - Esophagus - Foodpipe - Small intestine - Large intestine - Nervous system - Nerve - Spinal cord - Urinary system - Kidney - Bladder - Respiratory system - Trachea - Windpipe - Oxygen - Carbondioxide - Circulatory system - Blood vessel - Skeletal system - Spine - Backbone - Rib - Joint - Muscular system - Muscle	Digestive system - The body system that helps us digest food: digestive system - The tube that connects the mouth to the stomach: esophagus/ foodpipe - This organ absorbs the nutrients into the blood: small intestine - Where indigestible food and water are processed, stored and dispersed? large intestine Nervous system - The system that controls the body: nervous system - A fiber that sends messages between the brain and the body: nerve - The bundle of nerves inside the spine: spinal cord Urinary system - The system that removes waste from the blood and makes urine: urinary system - The organ that filters wastes from the blood and produce urine to get rid of it: kidney - The organ that stores urine before it leaves the body: bladder Respiratory System - The system that helps us breathe: Respiratory System - The tube that carries air to the lungs: trachea/ windpipe - The gas we breathe in that our body needs: oxygen - The gas we breathe out as waste: carbon dioxide Circulatory System - The system that carries blood through the body: Circulatory System - Tubes that carry blood through the body: blood vessel Skeletal System - The system of bones that supports the body: Skeletal System - The bone holds your body upright and also protects the spinal cord: spine/ backbone - The bones that protect the chest organs: rib - Where two bones meet: joint Muscular system - The system of muscles that helps the body move: Muscular system - The are attached to bones and move the bones. Muscle	
Disease	- Disease - Transmission - Germ - Prevention - Malaria - Dengue - Encephalitis - Hepatitis A - Parasite - Bacteria - Vaccinate - Alcohol - Body fluid - Infect - Syringe	- An illness that affects the body or mind: disease - How a disease spreads from one person to another: transmission - Tiny organisms that can cause disease: germ - Actions taken to stop disease from spreading: prevention - An organism that lives on or in another organism and causes harm: parasite Specific Diseases - A disease caused by parasites, spread by mosquito bites: malaria - A disease caused by a virus, also spread by mosquitoes: dengue - Inflammation of the brain, can be caused by viruses: Encephalitis - A disease that affects the liver, usually spread through contaminated food or water: hepatitis A Microorganisms and Vaccination - Single-celled organisms, some of which can cause diseases: bacteria - To give a shot to protect against a disease: vaccinate Methods of Transmission and Infection - A drink that should avoid to prevent hepatitis A: alcohol - Liquids from the body that can spread diseases (e.g., blood, saliva): body fluid - To make someone else sick: infect - A tool used to inject medicine or vaccines into the body: syringe
